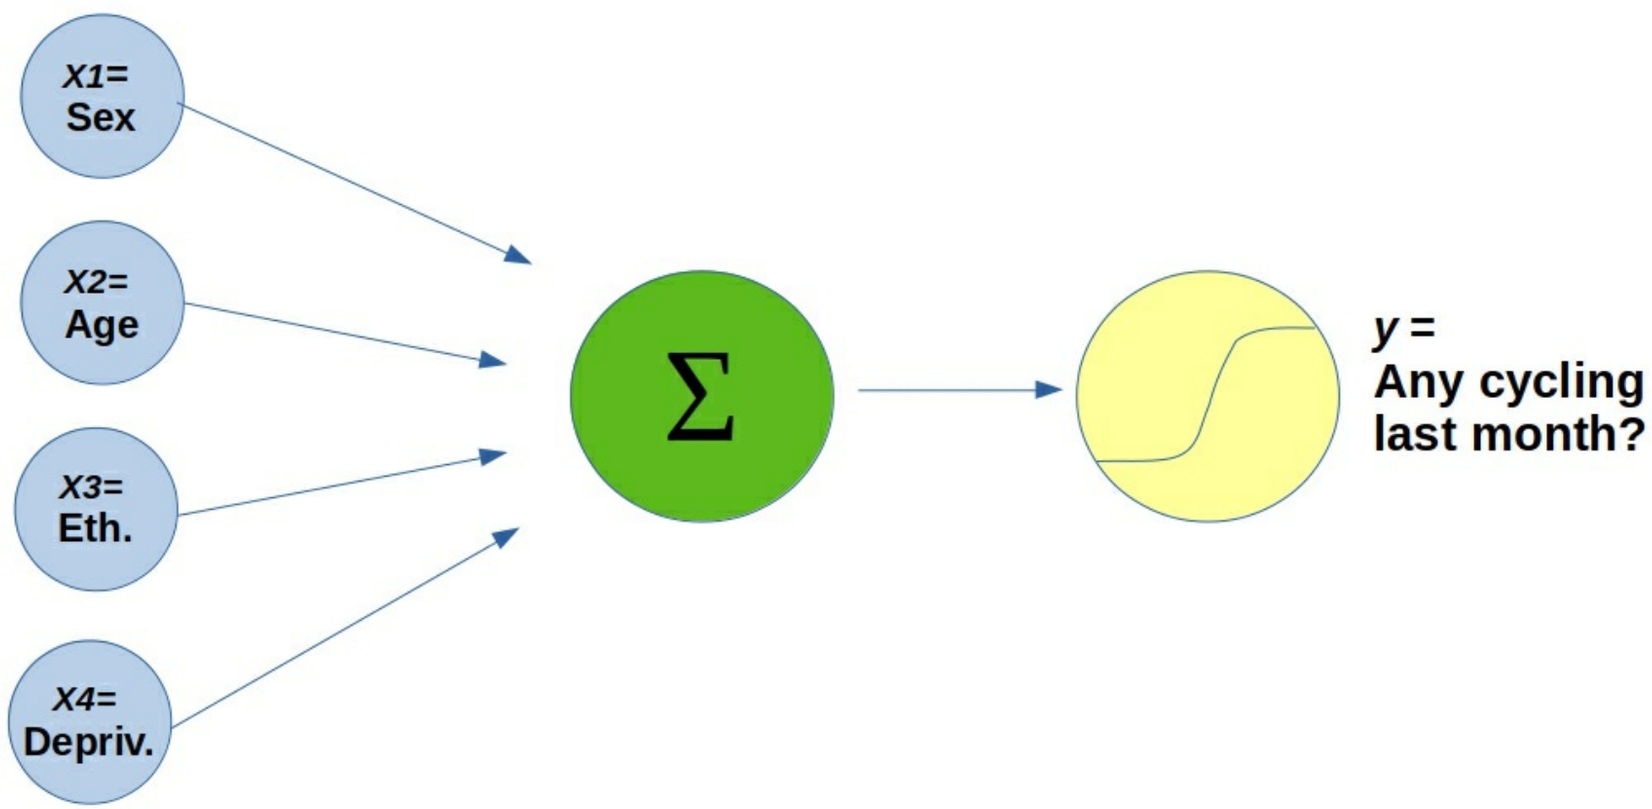
What is the magnitude of cycling inequalities currently in England?

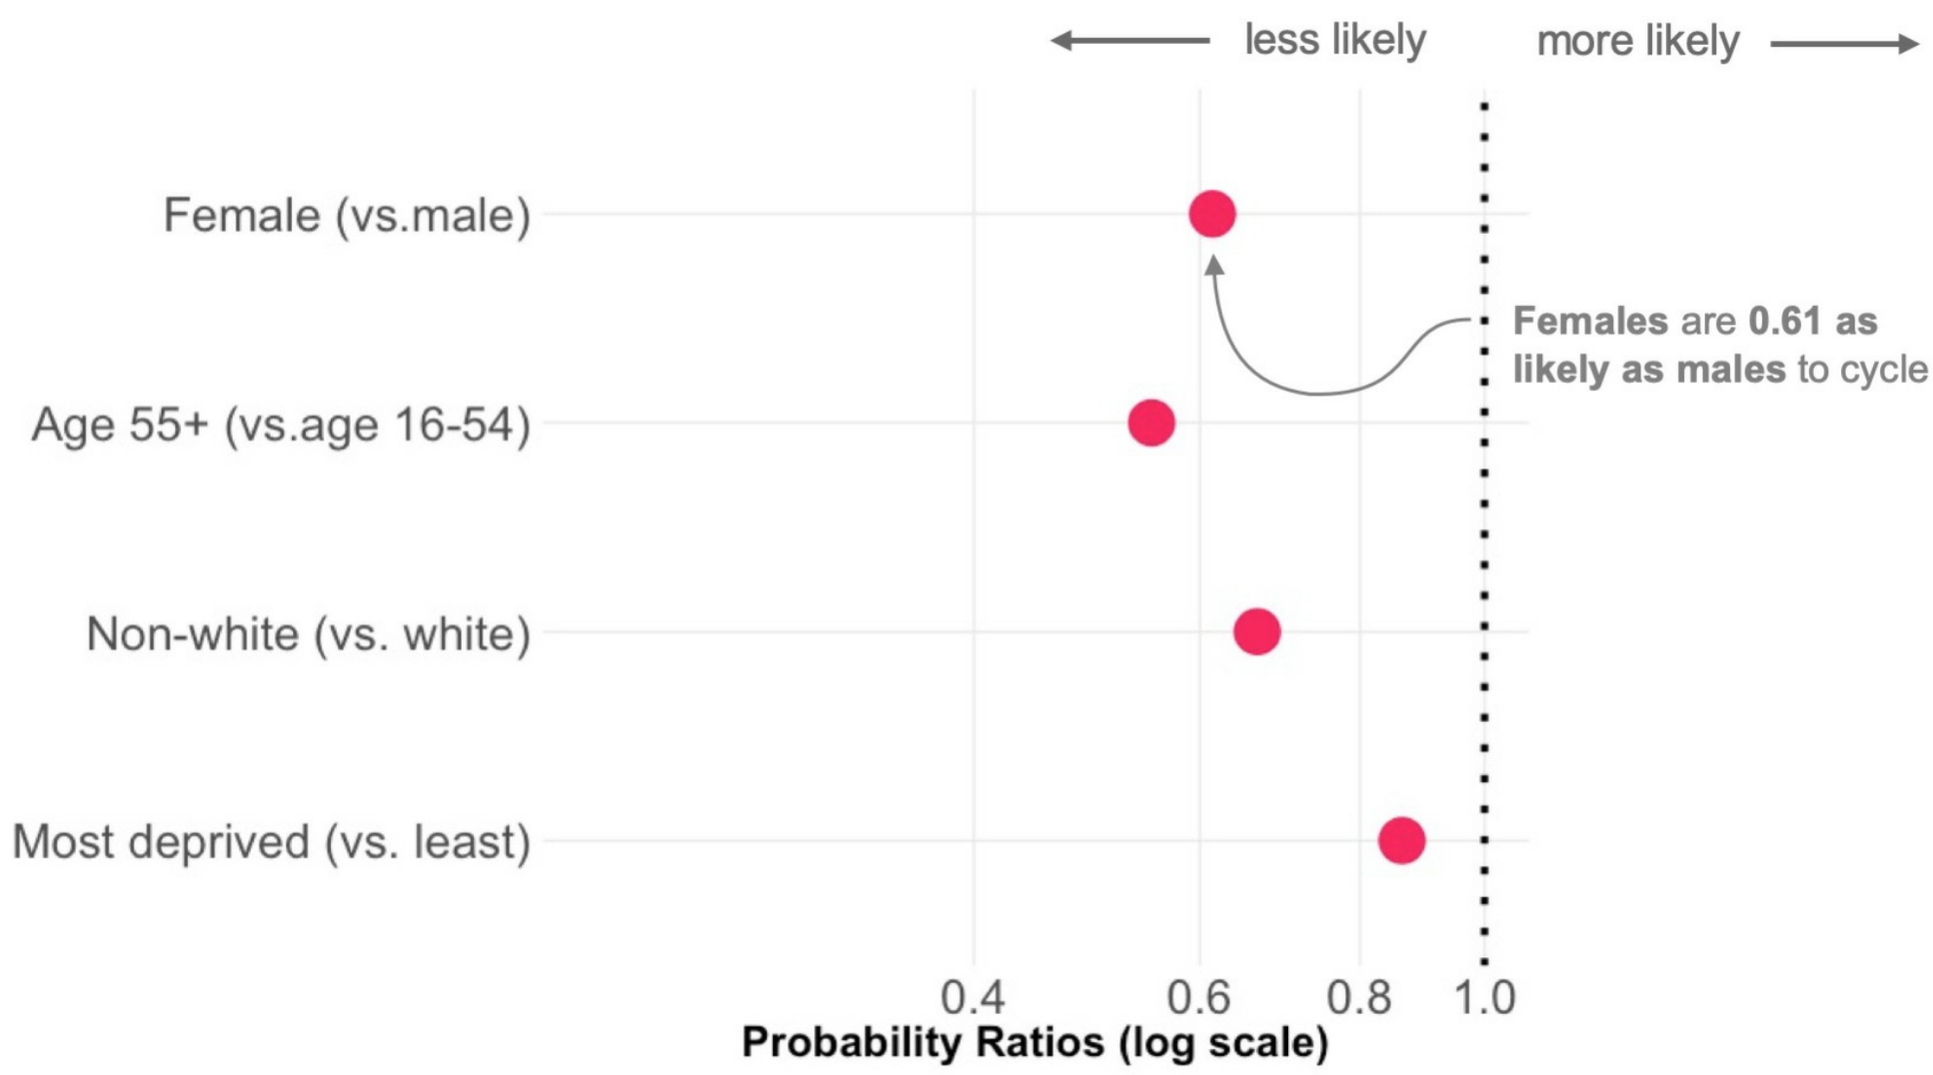
Method

- **Data**: Active Lives Survey 2015-2018 (sample of ~500,000 adults).

- **Statistical analysis**: Probability Ratios (PRs) using logistic regression.



Results



less likely
more likely
Female (vs.male)
Age 55+ (vs.age 16-54)
Non-white (vs. white)
Most deprived (vs. least)
Females are 0.61 as likely as males to cycle
0.4
0.6
0.8
1.0
Probability Ratios (log scale)

Conclusion

- Substantial **inequalities in cycling participation in England** are found in relation to gender, age and ethnicity.
- **More research is needed** to identify the barriers that create these disparities.

Thanks!
